

Foodopia Use Case 2: Home Page Display

Basic Flow:

1. The home page should display options for user to select meal plan.
2. Each meal plan can be described as how many meals per month. For instance, 30 meals/month, 45 meals/month, etc. Each meal should be further templated into number of dishes (eg: 2, 3, 4 dishes per meal)
3. The home page should also link to a separate page to display the full menu of this month. In the menu, every dish can have multiple tags, such as “breakfast”, “healthy”, “Lunch/Dinner”, “High Protein”, “Low Calories”, etc. These tags should be displayed on the menu page where a list of dishes listed. They should be displayed in the page for each individual dish along with a brief description of the dish.
4. In the full menu page, user can filter the menu using the tags or custom key words
5. The home page also links to a separate page to display the most popular dishes from last month.

Alternative Flow:

1. The database should also store the information of all the ingredients of the dishes. Such info may contain its name, category, unit price, etc. This is for operation team to calculate the cost in the future, and it should not be displayed to the customers.
